BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ **BLACK BORDERS**
- ☐ **IMAGE CUT OFF AT TOP, BOTTOM OR SIDES**
- ☐ **FADED TEXT OR DRAWING**
- ☐ **BLURRED OR ILLEGIBLE TEXT OR DRAWING**
- ☐ **SKEWED/SLANTED IMAGES**
- ☐ **COLOR OR BLACK AND WHITE PHOTOGRAPHS**
- ☐ **GRAY SCALE DOCUMENTS**
- ☐ **LINES OR MARKS ON ORIGINAL DOCUMENT**
- ☐ **REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY**
- ☐ **OTHER:** _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.

Please amend claims as follows

1. (Amended.) A method for selecting prints of photographs from a digital film medium, the method comprising:

(i) printing a selection sheet of thumbnail representations of photographs available on the medium to be printed, the selection sheet further comprising a plurality of selection fields, each thumbnail representation being associated with at least one selection field;

(ii) marking one or more of said selection fields according to a user choice of photographs to be printed;

(iii) inspecting the selection sheet to determine which of said selection fields has been marked in step (ii); and

(iv) performing one or more actions relating to the photographs stored on said digital medium, in accordance with said marked selection fields.

2. A method according to claim 1, wherein for each thumbnail representation a corresponding plurality of selection fields are provided.

Art Unit: 2652

3. (Amended.) A method according to claim 2, wherein step (iv) is a printing step and one type of said corresponding plurality of selection fields designates a print format in which the photograph represented by said thumbnail representation is to be printed in step (iv).

4. (Amended.) A method according to claim 2, wherein step (iv) is a printing step and one type of said corresponding plurality of selection fields designates a number of prints of photographs corresponding to a particular thumbnail representation to be printed in step (iv).

5. (Amended.) A method according to claim 2, wherein one type of said corresponding plurality of selection fields is a "deletion" field which, when marked, designates that a particular photograph corresponding to the marked deletion field is to be deleted from the film medium in step (iv).

6. (Amended.) A method according to claim 1, wherein said selection sheet is also provided with an identifier which is unique to the digital film medium and, wherein, in step (iii) said unique identifier is inspected in a preliminary step and, if the unique identifier does not correspond to a unique identifier allocated to the digital film medium, then the method terminates.

8. (Amended.) A method according to claim 1, wherein step (iv) is a printing step and in step (ii) a user fills in one or more of the selection fields according to user choice of photograph to be printed, user choice of number of prints of said photographs to be printed and user choice of format of said photograph to be printed.

9. (Amended.) A method according to claim 1, wherein marking of said selection fields in step (ii) comprises filling in said selection field so as to change said selection field from a light, unselected, condition to a dark, selected, condition.

10. (Amended.) A method according to claim 1, wherein in said step (iii) the marked selection sheet is scanned.

11. (Amended.) A method according to claim 1, wherein in said step (iii) only those parts of the selection sheet corresponding to selection fields are inspected and the information

Art Unit: 2652

gleaned from the inspection is processed to determine whether said selection fields are marked or unmarked.

12. (Amended.) A method according to claim 1, the method being implemented by means of a printer including a scanning mechanism in a feed path of the printer, wherein in step (i) the selection sheet is printed on the basis of data input directly to the printer by means of a digital film media interface, the printer being arranged to print out said selection sheet which is thereafter, in step (ii), manually marked by a user according to the user choice, the mark selection sheet then being input to the printer feed path and scanned by the scanning mechanism so as to perform the inspecting step (iii), data obtained during the inspecting step then being used so as to enable the printing in step (iv) of said one or more photographs.

13. (Amended.) A digital film enabled printer, said printer including a print head, a first interface for reading data from a digital film medium, a user interface for receiving commands from a user, a detector located in a paper feed path of the printer, a processor for processing data from said digital film medium and user commands from said user interface, the processor being arranged to create and to print out, using the print head, a selection sheet of thumbnail representations for photographs available on the medium to be printed, wherein said selection sheet further comprises a plurality of selection fields, each of said thumbnail representation being associated with at least one of said selection fields, the processor being further arranged for processing data from said detector so as to enable a user marked selection sheet input in the printer via the printer feed path to be inspected and a determination to be made as to which, if any, selection fields have been marked by the user and to enable the performance of one or more actions relating to the photographs stored on the digital film medium in accordance with the marked selection fields.

14. (Amended.) A printer according to claim 13, wherein said detector comprises a scanning mechanism associated with the print head of the printing means.

13. (Amended.) A printer according to claim 14, wherein said scanning mechanism is attached to the print head and movable transversely across the feed path in response to signals from the processor.

Art Unit: 2652

17. (Amended.) A printer according to claim 13, wherein one type of said plurality of selection fields designates, when marked, the print format in which the photograph represented by said thumbnail representation is to be printed.

18. (Amended.) A printer according to claim 16, wherein one type of said selection fields designates, when marked, the number of prints of photographs corresponding to a particular thumbnail representation to be printed.

19. (Amended.) A printer according to claim 16, wherein one type of said selection fields, when marked, designates that the photograph corresponding to the thumbnail representation is to be deleted from the digital film media.

20. (Amended.) A printer according to claim 13, wherein said processor is further arranged to read a unique identifier from the digital film medium via the first interface and to create and print out, using the print head, a unique sheet identifier on said selection sheet.

21. (Amended.) A printer according to claim 20 wherein said detector is further arranged for reading the unique sheet identifier and, the processor is arranged so that if the unique sheet identifier does not correspond to the unique identifier of the digital film media, then the performance of said one or more actions is inhibited.

22. (Amended.) A printer according to claim 20, wherein said unique sheet identifier comprises a bar code.

Please add the new claim as follows

23. A method for selecting prints of photographs from a digital film medium, the method being implemented by means of a printer having a scanning mechanism in the feed path, the method comprising: printing a selection sheet of thumbnail representations of photographs available on the digital film medium the selection sheet further comprising a plurality of selection fields, each thumbnail representation being associated with at least one selection field; marking one or more of said selection fields according to a user choice of photographs to be printed; feeding the marked selection sheet into the printer feed path for scanning by the scanning mechanism to detect which of the selection fields has been marked; and printing photographs stored in the digital film medium in accordance with the marked selection fields.
